

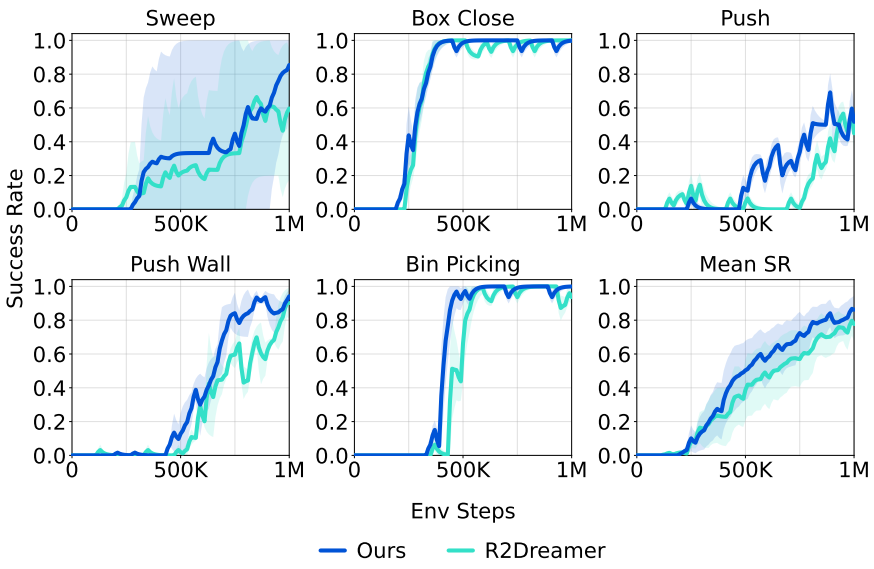

Figure 1: Comparison of ReDream and R2Dreamer on five Meta-World tasks using the R2Dreamer backbone.

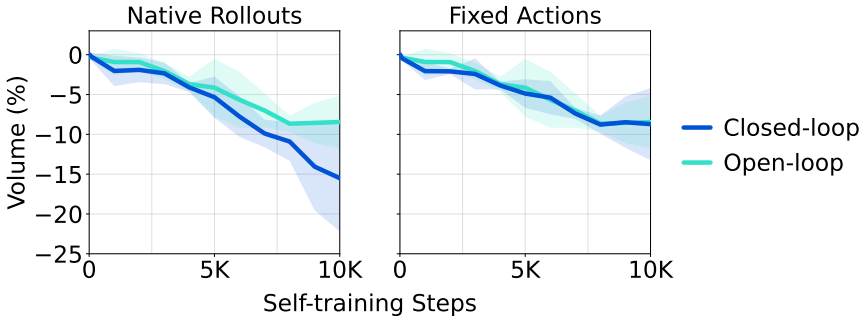

Figure 2: Effect of policy–model feedback on latent covariance volume during self-training. Closed-loop training induces stronger contraction than open-loop training under native rollouts (15.5% vs. 8.5%), while both show similar contraction under fixed actions (3 seeds).

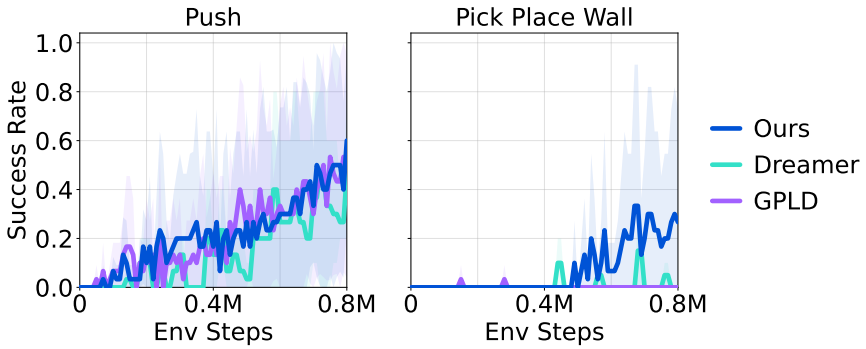

Figure 3: Comparison of ReDream, DreamerV3, and GPLD on two Meta-World tasks over three seeds.
